Web Design

Introduction to CSS

CSS : Cascading Style Sheets

It is a language designed to simplify the process of making web pages presentable.

It allows you to apply styles to HTML documents, describing how a webpage should look by prescribing colors, fonts, spacing, and positioning.

HTML uses tags and CSS uses rulesets.

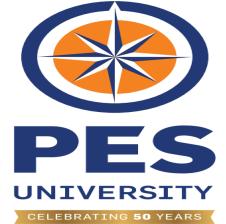

In CSS, a **ruleset** is the fundamental building block that tells the browser **how to style elements** on a webpage.

Web Design

Introduction to CSS

Why CSS?

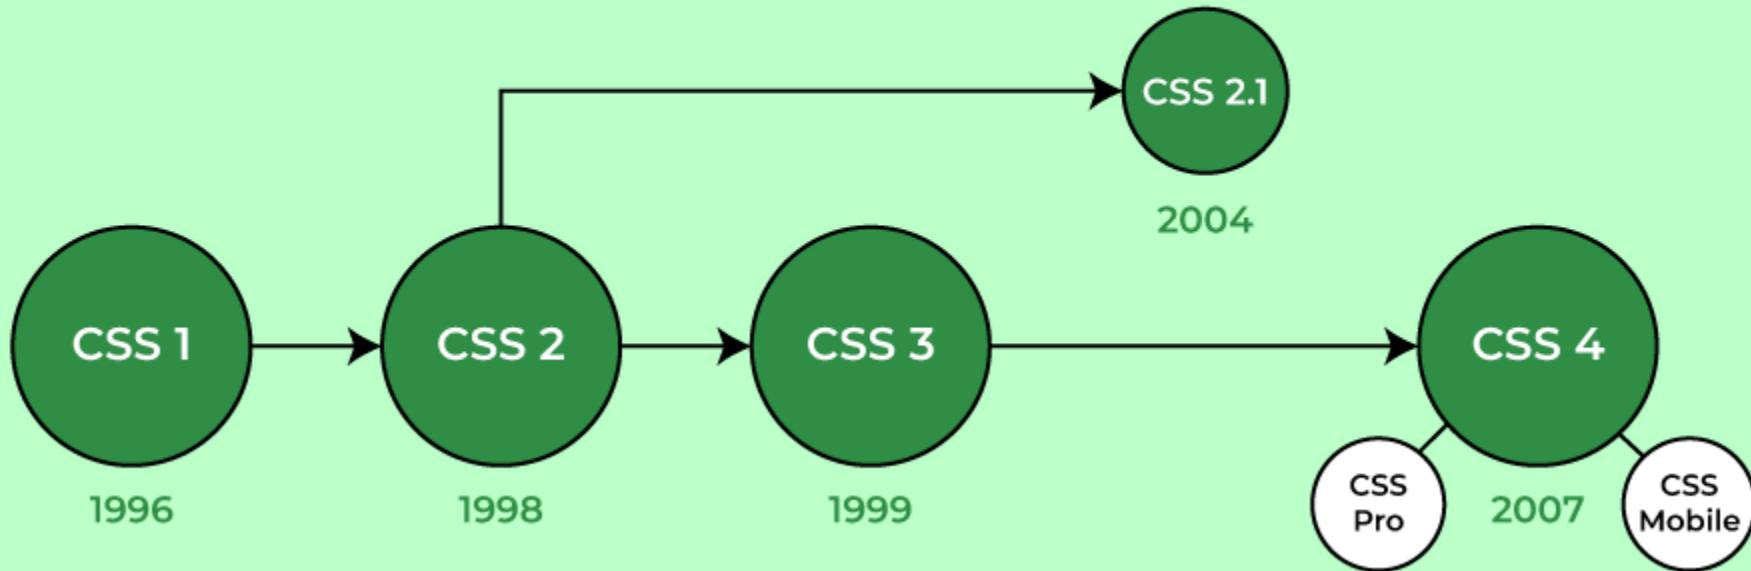

- 1) Saves Time:** Write CSS **once and reuse** it across multiple HTML pages.
- 2) Easy Maintenance:** Change the style globally with a **single modification**.
- 3) Search Engine Friendly:** Clean coding technique that improves readability for search engines.
- 4) Superior Styles:** Offers a wider **array of attributes** compared to HTML.
- 5) Offline Browsing:** CSS can store web applications locally using **offline cache**, allowing offline viewing.

Introduction to CSS

CSS Released Versions

CSS Released Versions

Web Design

Introduction to CSS

- CSS3 is a cascading piece of paper that specifies concerning the data with a joined hypertext mark-up language document displays.
 - CSS1 specification was developed in 1996
 - CSS2 was released in 1998
 - CSS3 is on its way since 2001
 - CSS3 – the **text shadows, borders with images, opacity, multiple backgrounds, etc.**
- CSS provides the means to control and change **presentation of HTML documents**
- CSS is not technically HTML, but can be **embedded in HTML documents**

Web Design

Introduction to CSS

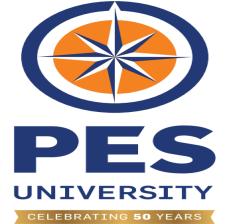

- Style sheets allow you to impose a standard **style on a whole document, or even a whole collection of documents.**
- Style is specified for a **tag by the values of its properties**
- Styles define how to display HTML elements
- Styles were added to HTML to solve a problem.
- External Style Sheets are stored in **CSS files as ".css"**

- Multiple style definitions will cascade into one. (**multiple style definitions** that apply to the same element, the browser uses a set of rules to decide **which one wins**. This process is called the **cascade**.)

Web Design

Introduction to CSS

CSS consists of **style rules** that are interpreted by the browser and applied to the corresponding elements.

- **How the Browser Interprets Them**
- The browser reads the HTML and builds the page structure (DOM).
- It reads the CSS and matches selectors with elements in the DOM.
- The style rules are then **applied** to those elements.
- If multiple rules affect the same element, the **cascade** decides the final style

Syntax:

*Style = "property_1:value_1; property_2:value_2;
property_n:value_n;"*

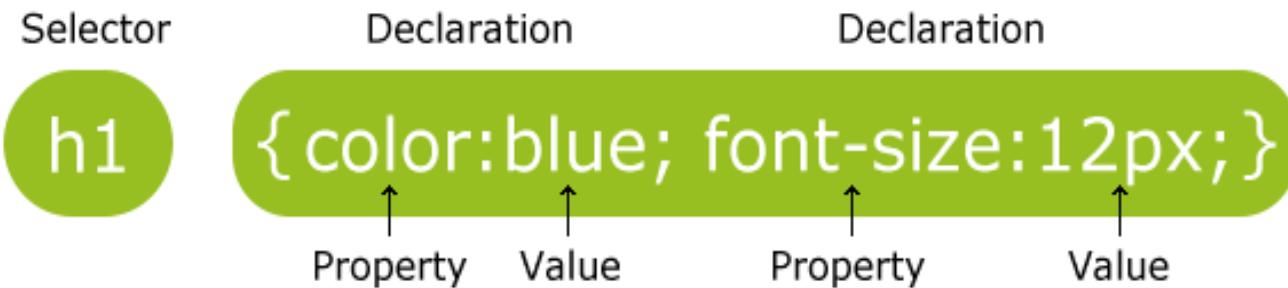

Web Design

Introduction to CSS

Example:

A **CSS rule** has two main parts:

- a selector
- one or more declarations:

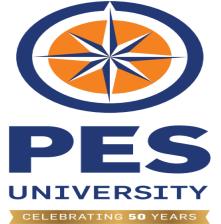

The **selector** is normally the HTML element you want to style.

Each **declaration** consists of a **property** and a **value**.

Web Design

Introduction to CSS

- **Style rules** (also called **rulesets**)
- Each rule has:
 1. **Selector** → which element(s) the rule applies to
 2. **Declaration block** → how those elements should look

Web Design

Introduction to CSS

Example:

```
<!DOCTYPE html>
<html>
<head>
<style>
p {
  color: red;
  text-align: center;
}
</style>
</head>
```

```
<body>
<p>Hello World!</p>
<p>These paragraphs are styled with CSS.</p>
</body>
</html>
```

Hello World!
These paragraphs are styled with CSS.
