**Creating UserForms & Event-driven  
Programming — Interacting with  
Users via Forms**

**Vignesh V**

Department of Computer Applications

## UserForm

---

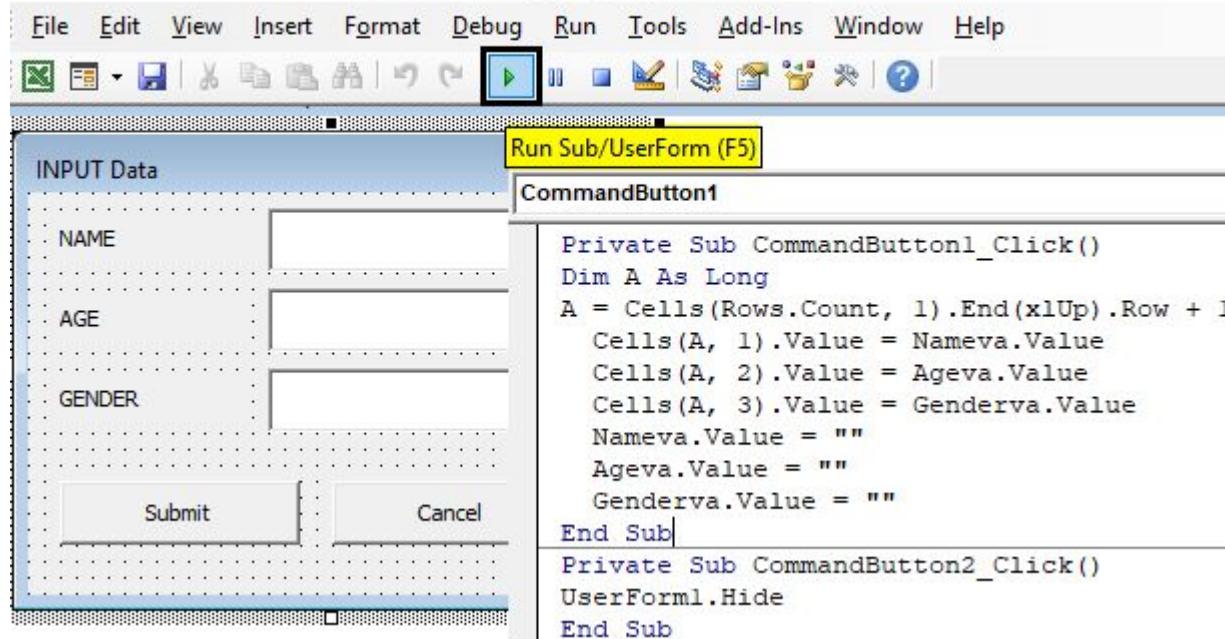

- A **UserForm** is a dialog box that enables interaction between users and VBA.
- It can capture input, trigger automation, or display information.
- Enhances user experience with structured input.

### Example:

A “Customer Entry Form” for Name, Age, Country, and Save button

# VBA UserForm

The screenshot shows the Microsoft VBA Editor interface. At the top is a menu bar with File, Edit, View, Insert, Format, Debug, Run, Tools, Add-Ins, Window, and Help. Below the menu is a toolbar with various icons. A yellow callout box highlights the 'Run Sub/UserForm (F5)' icon in the toolbar. To the right of the toolbar is a UserForm window titled 'INPUT Data'. The UserForm contains three text boxes labeled 'NAME', 'AGE', and 'GENDER'. Below these are two command buttons: 'Submit' on the left and 'Cancel' on the right. The code pane on the right side of the editor displays the following VBA code:

```
Private Sub CommandButton1_Click()
Dim A As Long
A = Cells(Rows.Count, 1).End(xlUp).Row + 1
Cells(A, 1).Value = Nameva.Value
Cells(A, 2).Value = Ageva.Value
Cells(A, 3).Value = Genderva.Value
Nameva.Value = ""
Ageva.Value = ""
Genderva.Value = ""
End Sub

Private Sub CommandButton2_Click()
UserForm1.Hide
End Sub
```

# Macro Programming

## Inserting a UserForm

### Steps:

1. Open VBA Editor (**Alt + F11**).
2. Go to **Insert → UserForm**.
3. Toolbox and Properties windows appear.
4. Save the workbook as **.xlsm**.

### Explanation:

This creates a blank canvas for your form design.

## Inserting a UserForm

Microsoft Visual Basic for Applications - [UserForm1 (UserForm)]

File Edit View Insert Format Debug Run Tools Add-Ins Window Help

Procedure... UserForm Module Class Module File...

Project - VBAProject

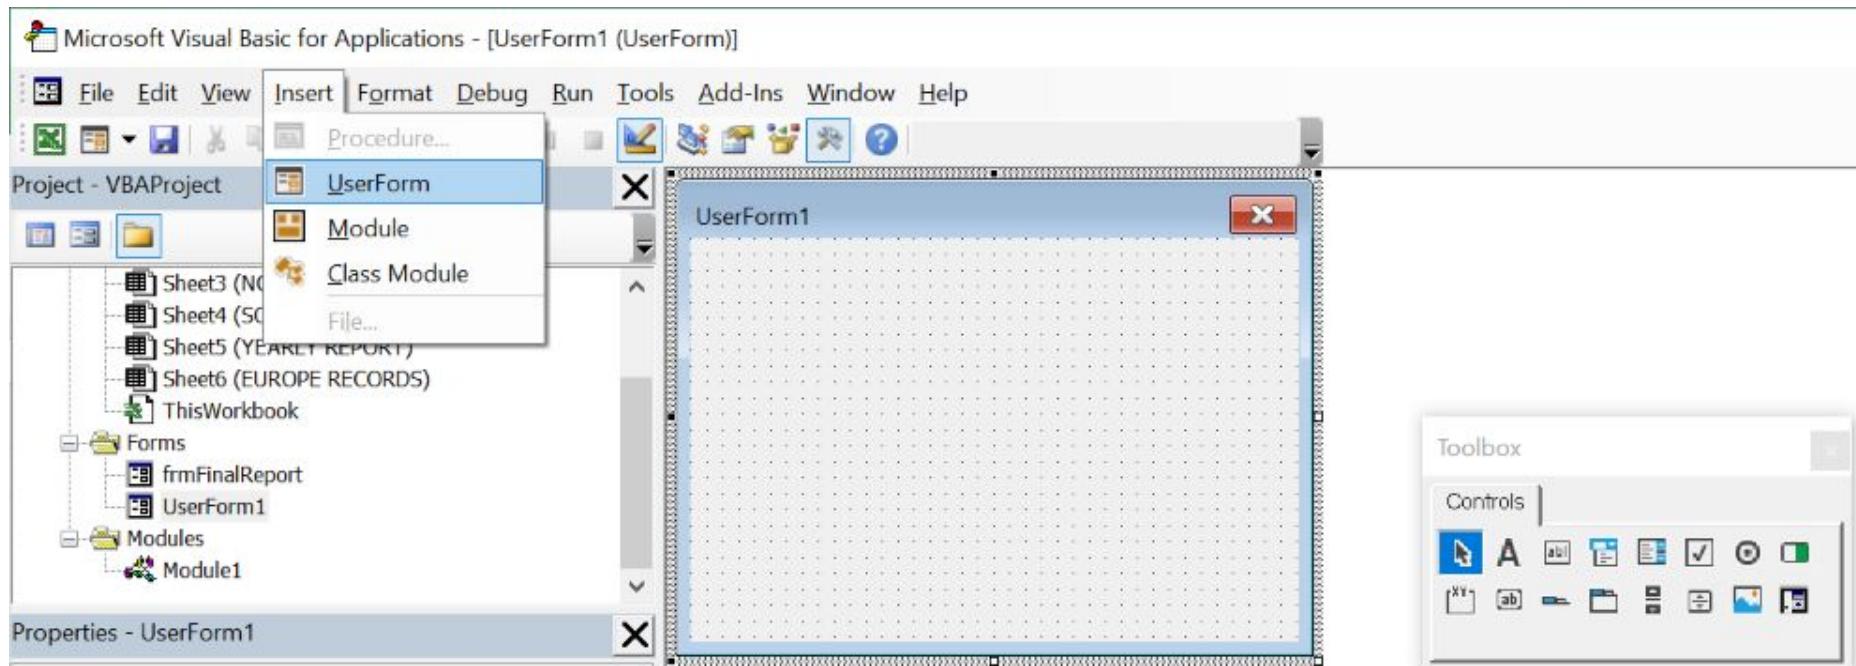

- Sheet3 (NO)
- Sheet4 (SC)
- Sheet5 (YEARLY REPORT)
- Sheet6 (EUROPE RECORDS)
- ThisWorkbook
- Forms
  - frmFinalReport
  - UserForm1

Toolbox

Controls

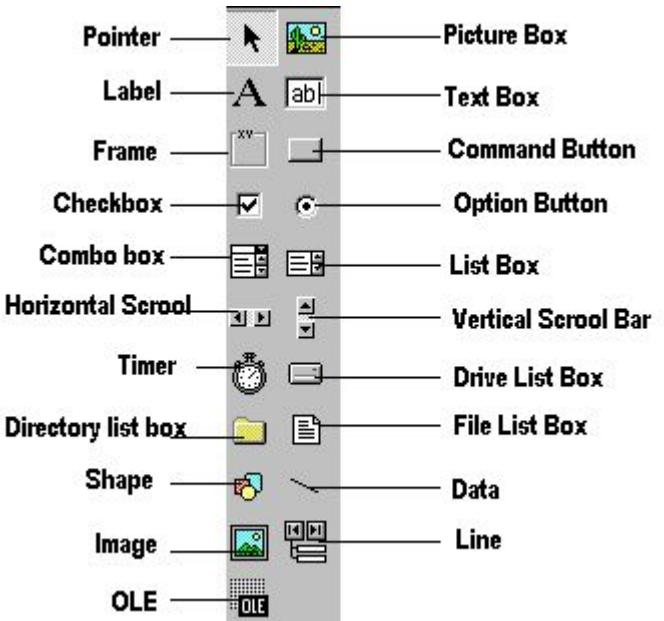

## Common Controls Overview

---

Control	Description	Example Property
Label	Static text captions	Caption
TextBox	Input text	Text
ComboBox	Drop-down list	RowSource
CommandButton	Executes code	Caption
OptionButton	Radio choice	GroupName
CheckBox	Yes/No selection	Value

## Common Controls Overview

## Setting Control Properties

---

Steps:

1. Select a control (e.g., TextBox).
  
2. Open the **Properties** window.
  
3. Change:
  - Name → txtName
  
  - Caption → “Enter Name”
  
  - TabIndex → 0

# Macro Programming

## Setting Control Properties

---

Naming and ordering controls systematically improves code readability.

## Event-driven Programming Concept

---

- Traditional VBA runs sequentially.
- **Event-driven VBA** runs only when triggered (e.g., a button click).
- Events include:
  - Click
  - Change
  - Initialize
  - Activate

## Example: Button Click Event

---

```
Private Sub cmdSubmit_Click()  
    MsgBox "Form submitted successfully!"  
End Sub
```

- When the user clicks **Submit**, this event procedure executes automatically.

## Initializing a Form

---

```
Private Sub UserForm_Initialize()  
  
    Me.cboCountry.AddItem "India"  
  
    Me.cboCountry.AddItem "USA"  
  
    Me.cboCountry.AddItem "UK"  
  
End Sub
```

- **Initialize** event preloads controls with data before the form appears.

# Macro Programming

## Passing Data to the Worksheet

---

```
Private Sub cmdSubmit_Click()
```

```
    Dim ws As Worksheet
```

```
    Set ws = ThisWorkbook.Sheets("Data")
```

```
    Dim nextRow As Long
```

```
    nextRow = ws.Cells(ws.Rows.Count, "A").End(xlUp).Row + 1
```

```
    ws.Cells(nextRow, 1).Value = Me.txtName.Value
```

```
    ws.Cells(nextRow, 2).Value = Me.txtAge.Value
```

```
    ws.Cells(nextRow, 3).Value = Me.cboCountry.Value
```

```
    MsgBox "Record added!"
```

```
End Sub
```

## Clearing Form Data

---

```
Private Sub cmdClear_Click()
```

```
    Me.txtName.Value = ""
```

```
    Me.txtAge.Value = ""
```

```
    Me.cboCountry.Value = ""
```

```
End Sub
```

- Prevents residual data; gives users a reset option.

## Modal vs Modeless Forms

---

```
Sub ShowModal()
```

```
    UserForm1.Show
```

```
End Sub
```

```
Sub ShowModeless()
```

```
    UserForm1.Show vbModeless
```

```
End Sub
```

## Experiential Task 1: Build a Data Entry Form

---

### Task:

Create a form to capture Name, Age, and Country, and store it in “Data” sheet.

# Macro Programming

## Experiential Task 2: Edit/Search Form

---

### Task:

Create a form to search by Name, edit details, and update sheet.

# Macro Programming

## Input Validation Example

---

```
If Me.txtAge.Value = "" Or Not IsNumeric(Me.txtAge.Value) Then  
    MsgBox "Enter a valid number.", vbExclamation  
    Me.txtAge.SetFocus  
    Exit Sub  
End If
```

## Worksheet and Workbook Events

---

```
Private Sub Workbook_Open()
```

```
    MsgBox "Welcome to the Form!"
```

```
End Sub
```

```
Private Sub Worksheet_Change(ByVal Target As Range)
```

```
    If Not Intersect(Target, Me.Range("A1:A10")) Is Nothing Then
```

```
        MsgBox "Column A changed!"
```

```
    End If
```

```
End Sub
```

## Debugging UserForms

---

- Use **F8** to step through event code.
- Debug **.Print** to log form values.
- Use Watch/Immediate windows for variables.

## Debugging UserForms

---

- Use **F8** to step through event code.
- Debug **.Print** to log form values.
